Mohammad Farshad Fazeli Sabzevar

Computer Engineering Undergraduate | Persian NLP | LLM Evaluation | Software Engineering

Tehran, Iran · farshadfazeli1397@gmail.com · +98 935 197 8105 · LinkedIn · GitHub · Portfolio

Profile

Computer Engineering undergraduate (expected Fall 2027) with research experience in Persian NLP and LLM evaluation, and professional experience as a .NET developer building enterprise CRM and ERP integrations. Current research examines how Persian orthographic variation and text normalization affect language-model performance in multiple-choice question answering. Seeking graduate study that combines rigorous experimental evaluation with reliable software systems.

Education

B.Sc. in Computer Engineering — Islamic Azad University, Central Tehran Branch, Tehran, Iran · Expected Fall 2027

GPA (last two years): 17.5/20

Selected coursework: Software Engineering (20/20), Artificial Intelligence (18/20), Database Systems (18/20), Data Structures (17.5/20), Discrete Mathematics (17/20), Advanced Programming (16/20).

Research Experience

Orthographic Variation and Input Normalization in Persian LLM Multiple-Choice Question Answering: A Paired Pilot Protocol

Collaborative Research Project · Persian NLP · LLM Evaluation · Experiments completed, awaiting supervisor review

This study investigates the effect of Persian orthographic variation and input normalization on multiple-choice question answering. It focuses on visually similar Persian and Arabic character forms, including yeh and kaf, and variations in word boundaries involving spaces and zero-width non-joiners (ZWNJ).

Contributed to the design of a paired evaluation protocol comparing original inputs, controlled orthographic changes, and two normalization approaches: an explicit rule-based normalizer and Hazm 0.10.0.

The experimental setup uses Qwen2.5-1.5B-Instruct (Q4_K_M), run locally, to evaluate answer behavior under different input conditions.

Examined accuracy, answer changes after orthographic perturbations, normalization-related recovery, and disagreements across repeated identical-input groups.

Primary-set results show that neither normalizer improved overall accuracy, and that the apparent recovery of perturbed answers is explained by restoration of the original input rather than by normalization itself. This is a methodological finding on how normalization benefits should be measured.

Status and scope: Experimental testing has been completed. The research is being conducted collaboratively with another researcher, and the manuscript is awaiting review by the academic supervisor. The findings are preliminary and limited to one small model and a relatively small evaluation set.

Selected Software Projects

FlakyScan — Flaky-test detector for .NET (C#, xUnit, GitHub Actions)

Command-line tool that reruns a .NET test project several times, parses the TRX results, and reports tests that both pass and fail, with their failure rates. Includes unit tests, a sample project with intentionally flaky tests, continuous integration, and documentation of how the chance of missing a flaky test depends on the number of runs.

LLM-Generated Tests for C# Libraries — Empirical study design (Coverlet, Stryker.NET), in progress

Reproducible study of whether LLM-generated unit tests for small open-source C# libraries reach high coverage but a low mutation score compared with the libraries' human-written tests, with and without a feedback round on surviving mutants. The repository contains the research questions, method, and threats to validity; experiments have not been run yet.

Microshop — Microservices teaching sample (.NET 8, ASP.NET Core)

Working teaching sample of an online store: six independent services behind an API gateway, with an MVC front end and in-memory data. A learning example, not a production system.

Dataverse Contact Status API — Sample Web API (ASP.NET Core, C#)

Web API that updates a Microsoft Dataverse contact's status by mobile number, using the Data8 service.

Professional Experience

.NET Developer — Samanehaye Modiriat, Tehran, Iran · 2024 – Present

Develop enterprise applications in C# and .NET on Microsoft Dynamics 365 CRM and Dataverse, using Clean Architecture, CQRS/MediatR, and Dependency Injection, with unit and integration testing. Client projects:

Ezam (Iran's largest importer of automotive parts) — **ERP integration:** Built 100+ Dynamics 365 plugins and 50+ endpoints serving about 2,000 users. Integrated the CRM with Rahkaran ERP APIs for inventory and business operations; implemented account settlement workflows, cheque-date tracking, and review of representatives and their products; developed web-based ordering and shipment pages.

Digikala (Iran's largest online retailer) — **customer and order workflows:** Built about 50 plugins and 20 endpoints with Clean Architecture and MediatR, integrating Digikala APIs to speed up product lookup inside the CRM. Implemented parcel pages, customer order lists, and customer classification.

Tara (one of Iran's largest buy-now-pay-later and cash-purchase companies) — **API integration:** Independently implemented the full Tara API integration with Clean Architecture and MediatR. The system records customer information from customer calls and displays customer history and account credit balance through the API.

AI Agent for Enterprise Software Development (ongoing prototype): Contribute to an agent connected to Microsoft Dataverse that automates recurring development tasks: retrieving solution metadata, generating model attributes, creating repositories, and assisting with Dynamics 365 plugin implementation.

PolyAraz (corporate website): Developed a product catalog website for a petrochemical company, and integrated external services, including SMS, with enterprise application workflows.

Technical Skills

Languages: C#, C++, SQL, JavaScript

Platforms and data: .NET, Microsoft Dynamics 365 CRM, Dataverse (Web API, FetchXML), SQL Server

Architecture: Clean Architecture, CQRS/MediatR, Dependency Injection, REST APIs, unit and integration testing

AI and NLP: LLM evaluation, Persian NLP, text normalization

Research Interests

Persian Natural Language Processing · Large Language Model Evaluation · Text Normalization · Applied Artificial Intelligence · AI-Assisted Development Tools · Software Engineering

Teaching and Knowledge Sharing

Delivered sessions on software design patterns (Factory Method, Strategy, Repository) in university and company settings.

Taught students a session on microservices architecture, supported by a hands-on .NET 8 sample application (course material).

Conducted internal sessions introducing AI-agent concepts and their applications in software development (session guide).

Languages

Persian: Native · **English:** Preparing for IELTS; target test date Spring 2027
